Dear Executive Leadership Team,

Whether this letter reached you through my GitHub repository or as a standalone introduction, it represents the same proposition: experienced technical judgment, visible engineering discipline, and practical AI-first execution.

I bring more than 30 years of hands-on software experience across distributed systems, real-time communications, SaaS platforms, Linux infrastructure, legacy modernization, and production support. My value is not limited to writing code. I help organizations define the right problem, make defensible architecture decisions, expose delivery risk early, and build foundations that teams can maintain after the first release.

Most recently, at Harding Instruments, I led the architecture and implementation of a distributed communications platform from a zero-development starting point. The work included Kubernetes clustering, fault-tolerant storage, TypeScript services, real-time state propagation, SIP integration, and backward compatibility with a legacy environment. It required rapid evaluation of unfamiliar technologies, clear tradeoff decisions, and the discipline to change direction when a unified TypeScript architecture offered a stronger long-term result.

AI is now embedded in how I engineer. Over a 21-month engagement, I used it continuously for research, architecture validation, debugging, documentation, code review, testing, and technical decision support. That experience has left me optimistic but unsentimental: AI increases leverage when paired with strong specifications, verification, security awareness, and accountable human judgment. I can help a leadership team adopt that leverage without confusing speed with quality or novelty with business value.

My public API repository provides evidence of how I structure work: versioned interfaces, automated testing, API documentation, explicit standards, and maintainable boundaries. The repository is intended to make technical evaluation easier; the accompanying résumé provides the broader record of experience and leadership behind it.

I am interested in senior engineering, architecture, and technical leadership opportunities where resilient systems, modernization, or responsible AI adoption matter. I would welcome a conversation about the risks you need reduced, the capabilities you need built, and how my experience could contribute.

Sincerely,

William Randolph Oak
